“Saddle bags,” “love handles,” abdomen, hips, waist, buttocks, neck, jowls, and arms: these “problem areas” often persist in spite of exercise and diet. When patients are troubled by stubborn fat, tumescent technique liposculpture is the easiest, safest, and most effective treatment option available.

Performed under local anesthesia by Matthew R. Kelleher, MD, Medical Director of Premier Dermatology, tumescent technique liposculpture provides rapid results with an easy recovery.

WHAT IS TUMESCENT TECHNIQUE LIPOSCULPTURE?

Tumescent technique liposculpture is a contouring procedure designed to enhance the shape of a patient’s body, remove unwanted fat, and create definition where there is none. This procedure was pioneered by dermatologic surgeons, who are the most widely trained and experienced in this procedure. As a result, these experts in skin care and surgery ensure the best possible results with the fewest complications.

HOW IS TUMESCENT TECHNIQUE LIPOSCULPTURE PERFORMED?

First, an anesthetic solution is locally infused into the fatty layer that is to be removed. Next, a very small instrument, or cannula, is inserted into the fat and moved in a gentle back and forth motion to release the tissue. Simultaneously, the fatty tissue is suctioned into a collection system. After the procedure is complete, the patient wears an elastic compression garment for approximately one week to help the healing process. Recovery is rapid, with patients back to work the following day and exercising in 2-3 days.

BREAST REDUCTION BY LIPOSCULPTURE

Liposculpture allows for breast reduction to be performed under local anesthesia safely and comfortably in our office. With this technique there are no stitches, minimal to no scars, and an almost painless and immediate recovery.

ARE THERE ANY RISKS?

Tumescent technique liposculpture is performed entirely under local anesthesia. As a result, patients avoid the complications of general anesthesia. Under local anesthesia, patients are comfortable, relaxed, and feel little to no discomfort.

While skin irregularity, lumpiness, dimpling, loose skin, numbness, infections and objectionable scarring are possible, they are extremely rare. Additionally, because the cannulas are about 1/3 the diameter of a drinking straw, incisions do not require stitches and leave minimal scarring.

WHO ARE THE BEST CANDIDATES FOR TUMESCENT TECHNIQUE LIPOSCULPTURE?

Tumescent technique liposculpture cannot take the place of a healthy diet and exercise. This procedure is most effective for areas that do not respond well to traditional weight loss methods. Morbidly obese individuals are generally not candidates for this procedure.

Tumescent technique liposculpture is the best procedure to change the contours of the body. When diet and exercise are insufficient, tumescent technique liposculpture can help to achieve a youthful shape.

To learn more about this procedure, ask any Premier team member or call to schedule a consultation with Matthew R. Kelleher, MD, Medical Director of Premier Dermatology.
